

# Coronavirus: The Truth You Need To Know

*Don't Be Scared - Be Informed and Be Prepared*

**FACT SHEET TO PRINT AND SHARE ON PAGE 14**

**SAFETY PRECAUTIONS ON PAGE 15**

## **A Public Safety Crisis Management Special Report**

March 14, 2020 Nikita Samuelle

(c) 2020 Metro-Atlanta Crime Commission

So out of nowhere comes the Coronavirus and people are dead. You don't know what to believe. In this special report we are going to separate lies from truth, fact from fiction and conspiracy theory from real life conspiracy in plain sight. And you can go to [www.publicsafety411.com](http://www.publicsafety411.com) to download, print and share this document with others.

**Watch this video: [https://www.youtube.com/watch?v=eup3\\_i\\_5uaw](https://www.youtube.com/watch?v=eup3_i_5uaw)**

Georgia, home of the CDC. And the Coronavirus has now come to Georgia, all over Georgia and much more than we know because there are neither enough testing kits nor enough people being tested. During the week of March 13, 2020 Governor Kemp of Georgia in a press conference stated we would begin testing 100 people per day. But wait people, there are over 498 thousand citizens in Atlanta alone, not including travelers, visitors and those who commute here for work. And because the virus is spreading, apparently washing your hands for 20 seconds is not stopping it. That should have never been thrown out to the public as a major solution and the MACC said that from the beginning, though it helps.

I am not going to say all that I know because I don't want to disappear. And no I am not exaggerating? Remember the CDC doctor who mysteriously and suddenly "committed suicide" in the Chattahoochee? He blew the whistle on the Flu vaccine. And while I am not claiming to

have secret inside information, we can analyze evidence and facts while putting two and two together. Much more so than most are paying attention enough to do.

### **FORTUNATELY MOST OF YOU WON'T BELIEVE ME SO I SHOULD BE SAFE**

When the citizen who brought the Coronavirus from Italy to Atlanta came home to the ATL, he flew on a commercial airline. That means everybody on the plane was exposed to this person while he was contagious. Those other passengers got off the plane, went home as well or went to work or school - all with no screening and no quarantine. That means the Coronavirus walked right through the busiest airport in the world undetected - Hartsfield Jackson International Airport. That means airport employees were exposed to the Coronavirus and bathrooms, restaurants, gift shops and other planes may be carrying the virus right now - maybe headed to your city from the busiest airport in the world. Yet were any steps taken or alarm bells sounded in Atlanta or at Hartsfield? Again all I here are crickets.

### **TRUMP BLAMED OBAMA ADMINISTRATION FOR VIRUS TESTING HINDERANCES: CNN 8:02pm EST**

One word you are not hearing our government nor the Coronavirus task force is the word "**Carrier**". A carrier can be a person who shows no symptoms, does not get sick but instead contagiously carries a virus which makes other people sick. The healthcare industry knows this but if you listen for the Federal Task Force to mention "carriers", all you hear are crickets. This should not be a political issue but the Coronavirus outbreak is being used as just that.

President Trump said he is not responsible for much of anything. President Trump refused to get tested initially, even though he was exposed to not one but two people who ended up infected. President Trump was on the podium at every press conference without observing "social distancing" and shaking hands. No matter what party you are a member of, that is not being an example for the country in a crisis. President Trump doesn't practice social distancing.

### **WHAT ABOUT THIS FEDERAL CORONAVIRUS TASK FORCE?**

Experts in their field? If you say so. But here are the facts. First the U.S. Surgeon General said the 3M N95 masks don't work. But why then did Trump say on national television that the government just ordered 40 million of them? Then the U.S. Surgeon General said don't buy the masks. But the CDC Director on March 4, 2020 exposed the truth and stated in the task force press conference the masks were needed for healthcare workers who would have to deal with Coronavirus patients.

Now we see that they want the masks for the healthcare industry while citizens have next to none, the virus spreads and we get sick unprotected. Then the Surgeon General says wearing the masks improperly may increase your chances of getting the Coronavirus. But instead of

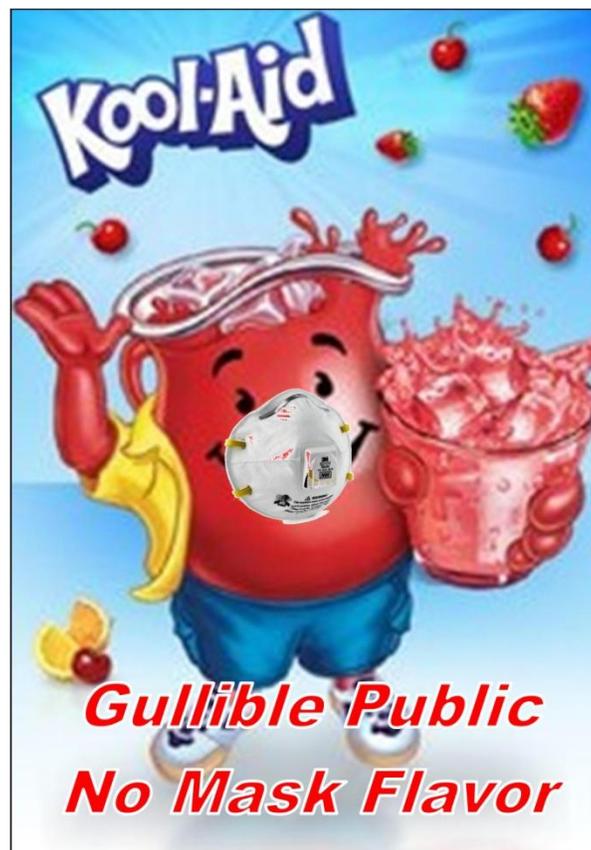

telling citizens how to wear them properly, the Surgeon General is discouraging people from protecting themselves in the best way possible. **BUY AND WEAR THE MASKS PEOPLE!**

## THE "WASH YOUR HANDS FOR 20 SECONDS" GAME

*The Coronavirus kills through **Acute Respiratory Distress Syndrome***

[https://www.youtube.com/watch?v=okg7uq\\_HrhQ](https://www.youtube.com/watch?v=okg7uq_HrhQ)

While washing your hands will help kill germs, **washing your hands will not stop airborne contagions from getting into your respiratory system through your eyes, nose or mouth** - much like pollen does in people who have Spring allergies. This is why a mask is necessary and the Surgeon General clearly must know that. But instead of saying that truth, the Surgeon General discourages wearing masks and clears the way for the healthcare industry to buy all of them. <https://www.cnn.com/2020/02/29/health/face-masks-coronavirus-surgeon-general-trnd/index.html> But if you do touch something, you are less likely to touch your nose and mouth if you have on a face mask. Do not drink the Coronavirus kool-aid people.

Vice-President Pence went to the Minnesota 3M mask factory and stated to the public that the government has contracted with 3M for 35 million masks per month. But wait, then why is the Surgeon General saying they don't work or not to buy them? If washing your hands is

the best defense, why aren't they telling healthcare workers to "just wash your hands for 20 seconds"? Because masks do work and the experts have known it all along.

President Trump said the Coronavirus is like the flu and will probably just go away. But the "experts" including Dr. Fauci said the opposite, that COVID19 is 10X worse than the flu. And there has been little to no mention of what is happening with the bodies of those who died from COVID19.

## **HOW COVID-19 SPREADED IN AMERICA SO FAST**

It should shock you that clearly one of the most advanced countries in the world is never ready when a tragedy strikes - Ebola, SARS, H1N1, H5N1 flu, hurricanes, tornadoes, earthquakes, take your pick. When these catastrophes happen, all of a sudden the "experts" seem not to know what the Hell to do. They struggle to figure out timelines, aggressive goals, immediate testing and who should take the lead. And on top of that, while they try and figure it all out, people die and viruses spread. Are our "experts" learning anything from each tragedy? And where is FEMA

In 2018 the Trump Administration disbanded and/or defunded the Pandemic Defense Office of the National Security Council. CDC funding was also cut. In January of 2020 the World Health Organization offered test kits to America through the Federal Government but the kits were refused. The first confirmed case of COVID-19 in America was on January 21, 2020. By February 4, approval was granted to the CDC to develop test kits. But by February 24, 2020 the CDC discovered kits were ineffective because there was contamination at the CDC itself in Atlanta.

When the Georgia resident returned from Italy on a plane full of people, he was likely contagious. And he walked through the busiest airport in the world, likely contaminating everything he touched as well as a plane full of passengers who had no idea. When the substitute teacher in Fulton County went to schools, even though he was sick, the virus spread again. When people all over Georgia who were exposed also could not afford to stay out of work, they went anyway instead of submitting to voluntary quarantine.

## **TESTING ISSUES: COMPLIANCE AND AVAILABILITY**

Initially the Federal Government would not allow states to develop their own testing procedures. Fortunately Governor Cuomo of New York stepped up, started contracting private labs and did it anyway. Now New York has the first drive-through testing facilities and a procedure for testing that is moving smoothly. That is a good example, an example of real leadership and taking aggressive initiative.

One huge problem with testing is community support, participation and responsible compliance. Let's look at each by the numbers. (1) Many people who may be infected will not

go to get tested because they can neither afford to miss work nor to be quarantined. (2) Many of those exposed to infected people also will not say anything. (3) When children get infected, parents will too but then still go to work. (4) When parents get infected, they go home and infect children who are out of school and go into close contact with their friends and other family. (5) Test results, if even available, are not immediate. And if you are tested on Monday but get infected on Tuesday, it will not show up on the test because you were not infected when you were tested. So don't stop the precautions just because your test was negative. Also experts do not know if you can be re-infected. And in the past, some viruses have been transferred back and forth from person to person in the same household.

Another huge problem is **the city and county governments seem more concerned about liability and budgets than about lives and public health**. Thus they are waiting far too late to act and waiting for someone else higher up to sign off on it first. Therefore we have barely heard from key local leaders such as mayors, police chiefs and county commissioners. Is it they don't know what to say nor what to do? Leaders in a time of crisis have the responsibility to lead - to reassure the public, to implement policies for the safety of their citizens, to work with the private sector in developing more solutions instead of waiting for state and federal governments, to establish hotlines, to offer and reiterate suggestions and recommendations for safety. And to even offer briefings from their own established panels of experts in every relevant area. Is this happening all over Georgia anywhere near the level it should?  
Nooooooooooooooooooooo.

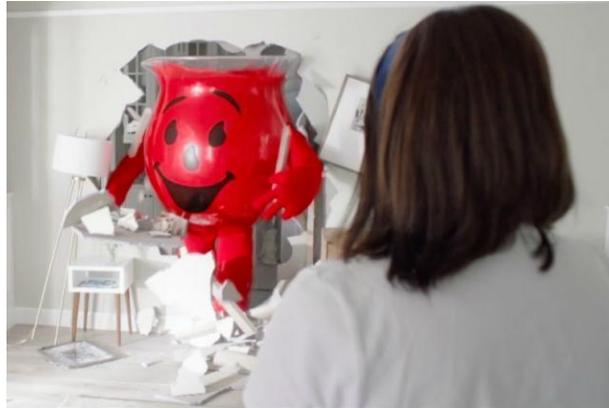

## **MISINFORMATION AND GUESSING**

On March 14, 2020 at 1:14pm during a press conference, the Surgeon General (Jerome Adams) said "almost all people will recover. 98, 99% of people will recover". But how can he say that when (1) Dr. Fauci says there is much we don't know about this virus yet, (2) it has not even run its first full course in America as of March 14, 2020, (3) they are learning more every day and (4) if they are so sure about these claims, why can't they slow it down, test for it faster, develop kits that work better or develop a vaccine yet? We should not be that gullible people. Wake up.

Furthermore, it is irresponsible to minimize the impact of the Coronavirus or give any approximate estimates when it is spreading rapidly and it has not even run its first full course yet. Has it been here before? And, like the flu, MERS or SARS, is this a stronger strand of Coronavirus come back to get us? Research suggests it is. But was it being tracked? Was it expected? Was there any preparation? Who knew about this? And why does such an advanced nation (America) seem to get caught off guard almost every time?

Ironically with all the close contact and handshaking that President Trump and Vice-President Pence have done, the President declaring a national emergency, the virus spreading fast, both

leaders being in close contact with many people daily and at least two people who the president was in close contact with - Trump was just tested on March 13 and as of the March 14th press conference, VP Pence had not even been tested. Irresponsible and bad examples.

## **TIMING IS EVERYTHING**

So here we go. In 2019 the United States was in a fierce economic battle with China and tariffs were flying back and forth. America was losing that battle and in an election year, no less. Then, all of a sudden, China was hit with the Coronavirus and everything changed. They had to shut down cities and quarantine millions. Did America know about the Coronavirus before 2020? Yes, simply look on the back of the Lysol can and it states that it kills the "Coronavirus". And I have a can of Lysol from years ago that says the same thing. Meanwhile, before 2020, for years we in America have been told we had respiratory infections or the flu. Or was it the Coronavirus growing stronger and on the loose all along?

## **CRUISE SHIP CORONAVIRUS OUTBREAKS**

Finally the cruise ship companies began shutting down. Again focused on profit instead of safety, a bad move which allowed for infections and the spread of COVID-19. The Princess Cruise Lines Diamond Princess cruise ship was heavily infected with the Coronavirus. Then Grand Princess ship from the same cruise line is at risk. That is because people in California are contracting the Coronavirus. That is also likely because some of the staff from the first infected ship may have gotten on the second ship. Then we heard that as many as 50,000 people may have been exposed. Workers should never have been transferred from one infected ship to a ship that was not. The first ship had virtually no preparation for such an outbreak, no proper equipment and no staff trained to deal with an outbreak. Do we live on a planet full of idiots pretending to be experts? Or are they allowing it to spread? After so many past outbreaks, why does it seem they don't know what to do?

## **AIRLINE SPREADING**

Airlines have began cutting flights, Jet Blue and United to name a few. They also dragged their feet due to profit concerns. Screeners at LAX have become infected and the virus is spreading. That means it is

walking its way through airports and people traveling are being exposed, taking that exposure to destinations nationwide. And part-time screeners are not even given health insurance.

## **STATE, COUNTY AND CITY RESPONSES**

As of March 5, 2020, in Georgia we had heard very little information of prevention and substance from the Metro-Atlanta counties, from the City of Atlanta, from the CDC based in Georgia, from our police departments and other first responder offices. We cannot afford for our First Responders to get sick yet as of the date of this document, they still had not been issued safety kits. They should have received a mask, latex gloves, hand sanitizer and Lysol at least. But police chiefs are often being silent and interdepartmental memos are not safety kits. **The Metro Atlanta Crime Commission has made the effort to get some of these safety resources to as many of our First Responders as possible as well as to our senior citizens, but we have a very limited supply.**

Agencies seemed to be waiting stagnant and citizens are still not taking this pandemic seriously, believing what they were told - that washing your hands for 20 seconds is the best defense. Not true. Finally on March 12, 2020 America starting realizing how serious this matter is. Businesses, schools and large group gatherings are closed down, but they still waited far too long. America stop thinking intervention first and start thinking prevention. Thinking intervention in a pandemic is a dangerous mindset when addressing a virus that spreads so rapidly.

In Georgia on March 13th the Governor held a press conference in which he announced he was leaving it up to cities and counties if they wanted to close down and to what extent. Again this should have happened earlier. On March 14, 2020 Governor Kemp declared a state health emergency. Again this should have happened weeks ago. Fulton County had a briefing on FGTV in the week ending March 7, 2020 but yet again said very little because they "appear" to know very little. The MACC recommended shortly thereafter that they began shut downs.

## **BOOST YOUR IMMUNE SYSTEM**

Absent from the solutions by the so-called "experts" is a set of instructions on how to boost your immune system, your best biological defense to the germs, bad bacteria and viruses that try to invade, attack and destroy us every week. We suggest you go to Google and other internet search engines to find ways to boost your immune system. Even speak to a naturopathic doctor (ND), a homeopathic medical doctor, a nutritionist and herbalist. They can likely tell you how to increase your body's defenses. On February 10th there were 12 identified cases. One month later there were 1,200 cases.

## **VACCINES: ARE THEY DANGEROUS?**

Labs, doctors and health specialists are scrambling to create a Coronavirus vaccine. But unfortunately there is widespread disagreement among "experts" as to how long that will take, how long a person is contagious, who will develop the vaccine, who will take the lead, who it will be tested on, guidelines for FDA approval, how it will be given to the population and a host of other concerns. Remember many

people have died from vaccines for other diseases in the past, including flu vaccines. So in the rush to be the first to get a vaccine on deck, some companies will not make the best decisions.

## **SEASONAL COMPLICATIONS**

With the weather irregularities in so many States around the country, we are also coming off of cold and flu season. Then many viruses and germs thrive and spread in warm and hot weather. Spring is right around the corner and Summer is not far behind. Spring brings pollen and that means some who have the Coronavirus will be confused with those exhibiting allergy symptoms. Remember to get tested if you think you are infected and have the symptoms. Call your doctor, don't just run up in the emergency room if the symptoms are mild. Buy and wear a mask.

## **SOLUTIONS**

**BUY A MASK OR AS MANY N95 MASKS AS YOU CAN FIND!** Masks serve a purpose, or again, the federal government would not be buying up millions of them. Your best weapon against the Coronavirus is to stay updated with sound and solid information, think through the obvious idiotic limited suggestions and think preventive. Also avoid large group gatherings such as sports events and concerts. Yes wash your hands and buy Lysol. Strengthen your immune system with natural foods and vitamin immune system boosters. Share **this report from [www.publicsafety411.com](http://www.publicsafety411.com)** and before you take a vaccine, weigh out the risks. **GET YOUR PREP KIT TODAY!**

# **Using Masks and Making Strong, Safer Hand Sanitizer (What You Are Not Being Told)**

## **MASKS WORK**

Masks do work in blocking airborne pathogens and contagions. If they did not work, President Trump would not have ordered 40 million masks for healthcare workers in February of 2020, not for those infected. If masks did not work, the Vice-President would not have visited the 3M factory in Minnesota in March, 2020 and placed a standing order for 35 million N95 masks per month until further notice. If masks did not work, the head of the CDC would not have announced in a press conference that they need the N95 masks for healthcare workers. A mask is not a guarantee but a necessary precaution.

## **WEARING THE MASK PROPERLY**

Wearing the N95 mask properly is very important. For masks with the top and bottom straps, place the bottom strap on first and let it rest on the bottom of your neck. Then position the mask securely on your face, covering your nose and mouth completely. Place the second strap around the back of your head. Then slightly pinch the metal strip on the top of the mask. Breathe normally. The N95 mask with the respirator on top allows the mask to stay cooler which allows you to keep the mask on longer.

## WHAT ABOUT OTHER MASKS?

If you do not have an N95 mask, use the mask you have. Any mask offers some protection against airborne particles but some offer much more protection than others. And at the very least, masks of any type discourage people from touching their faces.

## RE-USING DISPOSABLE MASKS

Under normal circumstances the best way for a company to sell more masks is to say they are disposable. But when there is a shortage of masks, you may have to wear what you have several times because doing so is better than having nothing. Because the droplets from a sneeze traveling 100 mph and deposit up to 100,000 droplets in the air from just one sneeze, you need to wear the mask. In order to re-use the N95, take it off, spray the outside lightly with Lysol then place the mask in a zip lock bag.

**BEWARE OF FAKE MASKS: The masks immediately below are real.**

The masks above are real masks. Keep in mind there are other brands of N95 so if the box or writing is a different color, don't panic. That being said, there are fake masks which are now flooding the market.

## THE MASKS BELOW ARE FAKES

These are fake masks. Notice where the staples are. Notice there are no side flaps. Notice 3M in large bold black print. Notice how thick the staples are and how they look on the inside of the mask. Notice closely the cheaply-made filter. And notice the black writing at the bottom of the outside of mask that seems to fade, even though the mask is supposedly brand new. Cheap printing. All of these factors combined prove these masks are fakes.

<https://www.newsweek.com/alex-azar-coronavirus-masks-30-million-have-need-30-million-fight-america-senate-committee-1489058>

## MAKING YOUR HAND SANITIZER

Regular hand sanitizer, the one everyone is running to find, has harmful chemicals in it, largely for color, scent and longevity. Ironically there are only 2 ingredients needed for hand sanitizer. The alcohol is the only active ingredient. The aloe vera, the other key necessary ingredient, is simply to soften the skin and keep it from drying out because of the alcohol. Pure aloe vera juice (not gel) is safer and healthier. Read the back of the hand sanitizer everyone is hunting for, especially the warning and the chemicals listed on the bottom.

To make the sanitizer stronger, use 91% alcohol (Isopropyl) and mix it with 100% or virtually 100% Aloe Vera JUICE (Wal-Mart, Public and Kroger), not the gel. Mix 1 part alcohol with 2 parts aloe vera juice. Place in small bottles. Keep one bottle in the car and one with you at all times, including and especially at work. Don't believe anyone who says making this sanitizer is unsafe.

## FDA bans 28 active ingredients in hand sanitizer

[Kells McPhillips](#), April 12, 2019

Hand sanitizer is ubiquitous in some of America's germiest hotspots. [Airports](#), doctor's offices, classrooms, [gyms](#), portable toilets—you name it. The safety of the antiseptic substance has been

hotly debated for some time now. On Thursday, the U.S. Food and Drug Administration (FDA) [banned manufacturers from using 28 active ingredients](#) in over-the-counter bottles of hand sanitizer.

The government organization first announced its intention to analyze safety data on the antibacterial gel [back in 2016](#). Now, less than three years later, the FDA is specifically calling out toxic actives with a history of health concerns, like [triclosan](#) and [benzethonium chloride](#). Although 28 ingredients sounds like a substantial number, however, the change will effect less than 3 percent of the hand sanitizer marketplace. Most bottles of hand sanitizer you'll find on the shelves at the drugstore use ethyl alcohol as the antiseptic.

“Our action today aims to help provide consumers with confidence that the over-the-counter hand sanitizers they’re using are safe and effective when they don’t have access to water to wash with soap.”

“Our action today aims to help provide consumers with confidence that the over-the-counter hand sanitizers they’re using are safe and effective when they don’t have access to water to wash with soap,” says Janet Woodcock, MD, director of the FDA’s Center for Drug Evaluation and Research in a [press release](#). The organization will continue to study the public safety of three other chemicals sometimes found in hand sanitizer—benzalkonium chloride, ethyl alcohol, and isopropyl alcohol—before deciding if those, too, should be struck from the list of ingredients.

If fear of the dreaded spring cold prompts you to reapply your desk hand sanitizer on the hour, don’t forget to scan the ingredients list for any (completely unpronounceable) unsafe chemicals.

## **FDA issues final rule on safety and effectiveness of consumer hand sanitizers**

### **Action completes a series of actions on the FDA’s review of OTC antiseptic active ingredients**

For Immediate Release:

April 11, 2019

<https://www.fda.gov/news-events/press-announcements/fda-issues-final-rule-safety-and-effectiveness-consumer-hand-sanitizers>

The U.S. Food and Drug Administration today issued a [final rule](#) designed to help ensure that hand sanitizers available over-the-counter (OTC) are safe and effective for those who rely on them. The rule establishes that certain active ingredients are not allowed to be used in OTC hand sanitizers, formally known as topical consumer antiseptic rub products, which are intended for use without water, that are marketed under the FDA’s OTC Drug Review. The final rule also seeks to ensure that the agency’s safety and effectiveness evaluations and determinations for

consumer antiseptic rub active ingredients are consistent, up-to-date and appropriately reflect current scientific knowledge and increasing use patterns.

“Our action today aims to help provide consumers with confidence that the over-the-counter hand sanitizers they’re using are safe and effective when they don’t have access to water to wash with soap,” said Janet Woodcock, M.D., director of the FDA’s Center for Drug Evaluation and Research. “In today’s final regulation we finalized the FDA’s previous determination that 28 active ingredients, including triclosan and benzethonium chloride, are not eligible for evaluation under the FDA’s OTC Drug Review for use in consumer antiseptic rubs.

We’ve also reaffirmed our need for more data on three other active ingredients, including ethyl alcohol, which is the most commonly used ingredient in hand sanitizers, to help the agency ensure that these products are safe and effective for regular use by consumers. We believe industry has made good progress toward providing data and we will continue to provide updates to the public about the progress of collecting this data.”

Consumer antiseptic hand sanitizers provide a convenient alternative when hand washing with plain soap and water is unavailable. Millions of Americans use antiseptic rubs daily, sometimes multiple times a day, to help reduce bacteria on their hands. [The Centers for Disease Control and Prevention](#) advises that washing hands with plain soap and running water is one of the most important steps consumers can take to avoid getting sick and to prevent spreading infections to others. If soap and water are not available, the CDC recommends using an alcohol-based hand sanitizer that contains at least 60 percent alcohol.

As part of the June 30, 2016 [proposed rule on consumer antiseptic rubs](#), the FDA requested additional scientific data to support the safety and effectiveness of active ingredients used in OTC consumer antiseptic rubs.

At this time, three active ingredients—benzalkonium chloride, ethyl alcohol, and isopropyl alcohol—are being deferred from further rulemaking to allow for the ongoing study and submission of additional safety and effectiveness data necessary to make a determination regarding whether these active ingredients are generally recognized as safe and effective for use in OTC consumer antiseptic rub products. Their status will be addressed either after completion and analysis of the studies or at another time, if these studies are not completed. At this time, the FDA does not intend to take action to remove hand sanitizers containing these three active ingredients from the market.

Less than 3% of the marketplace will be affected by the issuance of this final rule, as most OTC consumer antiseptic rubs use ethyl alcohol as the active ingredient.

The FDA is aware that retailers and pharmacies continue to market a very low number of consumer hand sanitizers containing benzethonium chloride, but that they stopped marketing hand sanitizers containing triclosan. Drug products containing any ineligible active ingredients will require approval under a new drug application or abbreviated new drug application prior to marketing.

This final rule completes a series of rulemaking actions in the FDA's ongoing review of OTC antiseptic active ingredients to determine whether these ingredients are safe and effective for their intended uses. The FDA previously issued final rules on [consumer antiseptic washes](#) (Sept. 2016) and [health care antiseptics](#) (Dec. 2017).

The Metro Atlanta Crime Commission is putting the  
"public" back in public safety. **[www.publicsafety411.com](http://www.publicsafety411.com)**  
**SHARE THIS INFORMATION WITH EVERYONE YOU KNOW**  
**AND LET'S SAVE LIVES, NOT STAY QUIET TO AVOID LIABILITY**

The information in this document is meant to prepare you through prevention, not to scare you. But in order to prepare you, all of our agencies must think, be honest with citizens about what they know and offer steps for prevention of the spread of the Coronavirus. Just as it is with crime prevention, local governmental agencies tend to lack the balance of informing and preparing you for prevention while not scaring you or causing a panic. Check back with [www.publicsafety411.com](http://www.publicsafety411.com) periodically for more information.

**CORONA VIRUS PUBLIC SAFETY ALERT: GEORGIA 3/20**

**March 2, 2020 Corona Virus Hits Atlanta**

Please share this message including posting it on your social media and sending it to everyone you know. There is no need to panic, IF you know the truth and what steps to take.

You may be receiving tips by now that include washing your hands and not touching your face. That is not sufficient and the medical industry knows this. Washing your hands helps but does very little against an airborne virus or contagion. Airborne contagions can enter through the respiratory system, whether you touch your face or not.

The Surgeon General has stated that people should not buy and wear masks and that the masks will do no good unless it is to keep your germs from attacking someone else when you're sick. That is not likely accurate either because just like pollen in Spring, airborne contagions enter into your respiratory system through your eyes, nose and mouth.

It makes no sense to tell the public not to wear a masks when the government just ordered 40 million 3M masks per President Trump. These masks are likely for healthy healthcare workers who may have to work around those infected. Therefore masks do work and make a difference. If the government has most of the masks, this will leave the public with few masks and defenseless to airborne viruses.

The Corona virus is an airborne contagion that is not new. However this strand of Corona virus is apparently stronger than the previous ones. And if they knew about other strands of the Corona virus, was the public ever told before 2020?

You need to purchase a 3M brand n95, n99 or n95 100 masks, ideally with the respirator on the front. Also buy hand sanitizer, several cans of Lysol and a pair of goggles because airborne contagion can go through the nose, mouth or eyes. On the back of the Lysol can it states that Lysol can kill the Corona virus on external surfaces. Also research and prepare a list of foods and vitamins that boost your immune system.

As for the spread of the virus, it is likely that there are carriers who show no signs nor symptoms of infection. Thus they are unintentionally slipping through any type of screening. This is not being presented to the public at present.

Regarding the person who returned from Italy and brought the Corona virus to Fulton County Georgia, that person travels on a commercial airplane and therefore exposed everybody on the plane to that virus. If the airline did not locate all the passengers and quarantine them in their homes, the virus will be moving through Atlanta even faster.

And the plane simply loaded back up with passengers and crew then left back out so you can count on the virus spreading that way as well.

If you hurry, you can still order masks online at eBay or Amazon but sellers are price gouging.

To extend the life of your masks, after wearing the mask in public, spray the outside of it lightly with Lysol then placed a mask in a ziplock bag. The Lysol particles will permeate the mask and kill the germs. And since Lysol says it will kill the Corona virus, you should be able to reuse that mask.

**[www.publicsafety411.com](http://www.publicsafety411.com)**

## **CORONAVIRUS REAL SAFETY MEASURES**

***Most businesses, citizens, organizations, politicians and groups are following what the Surgeon General and the CDC are saying. But there is much more than you can do and you are NOT being told everything. Be informed! Be prepared!***

1. Buy a mask and wear it. Masks do work. The Coronavirus is an airborne contagion and attacks the respiratory system. If the mask didn't work, the federal government would not be ordering millions and millions of them for healthcare workers. Don't be fooled by people hiding the truth.
2. Buy the N95 mask if you can find it.
3. Wash your hands for 20 seconds in water as hot as you can stand it with antibacterial soap.
4. Avoid group meetings and gatherings. If you have to attend, practice social distancing.
5. When you come home, take your clothes off just inside the door, put them in a trash bag and then put them in the washing machine and wash on hot.
6. Don't shake hands.
7. Sneeze or cough into your sleeve. A sneeze travels 100mph and sprays 100,000 droplets.
8. Work from home if you can and limit those who come to your home. Practice self-quarantine.
9. Don't make multiple visits to the grocery store each week. Get everything you need while you're there and store up food and supplies. Then wipe down the food packaging with wipes.
10. Spray the inside of your car with Lysol and sanitize your steering wheel.
11. Avoid public transit and ridesharing as much as possible.
12. If you or your child become sick with a fever, cough and other symptoms, stay home.
13. Fill up your gas tank and make sure to spray your keys with Lysol immediately afterwards. Then use hand sanitizer immediately.
14. Use sanitizing wipes on your cell phone.
15. Leave your coats, jackets, hats and shoes in the front part of the house, not the bedroom or closet. Place in washer ASAP (hot water). Spray clothes and shoes with Lysol lightly.
16. Wear latex gloves in stores, at work, at gas pumps and as needed.
17. Lightly spray any packages with Lysol that you receive in the mail.
18. Boost your immune system naturally with the strongest foods/vitamin supplements you can.
19. Limit your travel anywhere as much as possible.
20. Use your hand sanitizer and if you cannot find it, make it yourself using at least 70% strength alcohol and aloe vera gel or juice.
